Praise for the Third Edition "...this is an excellent book which could easily be used as a course text..."  
"International Statistical Institute. The Fourth Edition of Applied Linear Regression provides a thorough update of the basic theory and methodology of linear regression modeling. Demonstrating the practical applications of linear regression analysis techniques, the Fourth Edition uses ...

In statistics, linear regression is a linear approach to modelling the relationship between a scalar response (or dependent variable) and one or more explanatory variables (or independent variables). The case of one explanatory variable is called simple linear regression. For more than one explanatory variable, the process is called linear regression. ...

History. The earliest form of regression was the method of least squares, which was published by Legendre in 1805, and by Gauss in 1809. Legendre and Gauss both applied the method to the problem of determining, from astronomical observations, the orbits of bodies about the Sun (mostly comets, but also later the then newly discovered minor planets).

Now consider the regression model shown next: This model is also a linear regression model and is referred to as a polynomial regression model. Polynomial regression models contain squared and higher order terms of the predictor variables making the response surface curvilinear.

### **Multiple Linear Regression Analysis - ReliaWiki**

Regression analysis is a statistical technique that attempts to explore and model the relationship between two or more variables. For example, an analyst may want to know if there is a relationship between road accidents and the age of the driver.

The question of how many independent predictor variables may be included in a multivariable regression model is one that is faced by statistical analysts and applied researchers in diverse fields of research.

Hi Ji-A. I used a simple linear regression example in this post for simplicity. As you alluded to, the example in the post has a closed form solution that can be solved easily, so I wouldn't use gradient descent to solve such a simplistic linear regression problem.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
