Maxwell Betti's Reciprocal Theorem: According to this law the amount of work done by first load system due to displacements due to second load system, is equal to the amount of work by the second load system due to displacements due to first load system at their respective co-ordinates.

Betti's theorem, also known as Maxwell-Betti reciprocal work theorem, discovered by Enrico Betti in 1872, states that for a linear elastic structure subject to two sets of forces $\{P_i\}$, $i=1, \dots, m$ and $\{Q_j\}$, $j=1, 2, \dots, n$, the work done by the set P through the displacements produced by the set Q is equal to the work done by the set Q through the displacements produced by the set P .

Betti's theorem - Wikipedia

According to the Maxwell-Betti Reciprocal Theorem, $F_i \delta_{ij} = F_j \delta_{ji}$ (the work done by one load on the displacement due to a second load is equal to the work done by the second load on the displacement due to the first), or, equivalently, $f_{ij} = f_{ji}$ (the flexibility matrix is symmetric).

Therefore if the moment diagram is known, it will be easy to construct the elastic curve. In particular, there must be an inflection point at the point where the curve changes from concave down to concave up, since this is a zero moment.
