Solution: In this problem heat from the water raises the temperature of the carbon until they are both at the same temperature. Saying it simply, this is a Goesinto problem. Saying it simply, this is a Goesinto problem.

**How To Solve Physics Problems Temperature and Calorimetry**

I was doing a problem in thermodynamics where the net heat is 0. I don't understand why if you have say a copper calorimeter with water at say 15 °C and add a mass of copper at a higher temperature say 90 °C that when calculating the final temperature you would use for the copper piece this in the formula:  $Q = mc(T_f - T_i)$  Where f is for final and i is for initial.
